

## Join the revolution in low cost backwash water recycling

At Statewide Pool Services we're constantly exploring new and innovative solutions for our customer's needs. That's why we've partnered with irrigation and horticulture experts, Aquatek, to produce a low cost state-of-the-art backwash recycling system, saving you time and money through more efficient use of your pool's backwash water and existing infrastructure.

### How it works

#### Mapping and testing

Statewide Pool Services will create a GPS map of your existing system. This will help when planning future maintenance and capital works projects. At the same time we'll test your soil and source water, making sure the processed water is compatible with your garden and soil type.

#### Overhead irrigation

Implementation of this system is extremely flexible. We can connect to your existing overhead irrigation system or design and install an entirely new system when and where required.

#### Single backwash tank

Your new system will process water directly from the existing backwash tank, above or below the ground, eliminating the need for a second storage tank.

#### Self cleaning filter

Automatically sensing pressure build-up, the system initiates a cleaning cycle before returning to normal filtration mode. So the operator isn't required for this or any other part of the processing system.

#### Ultra Violet Disinfection

A UV system removes pathogens from the water rendering it safe for overhead spraying.

#### EPA and Health Commission approved

The Backwash Recycling System has been examined and approved by relevant regulators, (subject to usual periodic testing), saving you a lengthy and uncertain approval process.

#### Let's talk

We're excited by the positive impact this system is already having on the community and commercial pool industry and we'd love the opportunity to discuss its many advantages with you. Contact Statewide Pool Services today and get more out of your water processing system.
